### 1. What's new?

New features:

- N/A

Improvements

- Besides specified TP couplers now also IP coupler can manage the full Group Address filter table range (manufacturer should support this explicitly, e.g. with a new product database)
- Memory allocation reduced on creating some report type

### 2. What has to be considered?

- N/A

### 3. Solved Problems

- Text (e.g. for visualization) will be downloaded correctly into a device also on other code pages rather than ISO 8859-1 (e.g. Cyrillic ISO 8859-5)
- Projects with dummy devices and hence this a lot of group addresses do not cause a memory system overflow on report creation
- Navigation with cursor within the tree view under Windows 8 (.NET 4.5) again possible
- Changed column configuration in monitor is considered in the workplace as „changed“ and saved as well
- On project export under Windows XP in some circumstances a file without file extension is created; this problem is solved
- Displaying of products texts from Online KNX Product Catalog is done in the ETS Import Wizard also in the correct language
- If an ETS App is saved within the ETS workplace but for any reason is later on no longer licensed, at the next start of ETS its user interface will be cleaned-up accordingly

### 4. Download

- New installations (setup): Download and install version 4.1.5 from [MyKNX](#) and subsequently online update of ETS.
- Existing installations: Via ETS4 online update.
