1. What's new?

New Features

-

Improvements

- Optimization of installation, usage and error messages of ETS Plug-Ins, e.g. when .NET framework is not available, when administrator access rights are required, when the Plug-In software is not installed and others. With this new improvement, the section "Clear Plug-In Cache" in the "Troubleshooting" section of ETS is hence not necessary, but is not removed right now.

2. What has to be considered?

- N/A

3. Solved Problems

- Automatic decoding of order numbers according to manufacturer definition (as long as they are available by manufacturer in the ETS master data), is now displayed/decoded correctly (device info).
- Calculation of the bus current in lines (topology) is now calculated realistically with 10mA when there is no information about it.
- Defined Datapoint Types by manufacturers do not disappear after project import.
- Some devices without Group Objects can now be inserted in the project.
- Parameter of certain devices can now be adjusted.

4. Download

- New installations (setup): From [MyKNX](#).
- Existing installations: Via ETS online update.
